

Secondary Screening vs Staff Mapping

WHAT IS THE DIFFERENCE?

What is Secondary Screening?

Secondary screening is the process used after a staff member is denied entry to the workplace due to COVID-19 related symptoms or who do not pass the active screening questions.

During secondary screening, a DOC medical professional contacts those staff to further assess their symptoms and help identify if they are able to return to work or if quarantine or isolation is required.

What is Staff Mapping?

Staff mapping is the tracing process used when an individual is suspected of or has confirmed COVID-19. Staff Mapping is a critical tool used to identify people who have been in close contact (within 6ft for 10 minutes or more) with someone who has suspected or confirmed COVID-19.
